## Overview

- Introduction
- National silage additive schemes in Europe
- The EU authorisation of silage additives
- The German DLG additive approval scheme
- Comparison of the German DLG and the French INRA schemes
- Testing silage additives in round bales
- Conclusions

## Characteristics of European silage additive approval schemes active in 1996

Country	Start	Compulsory	Positive control required	Farm or lab scale silos	Reference
Finland	1987	Yes	Yes	Both	Mannerkorpi et al. 1996
France	1979	Yes	Yes	4m <sup>3</sup> -silo	Demarquilly and Andrieu 1996
Germany	1990	No	No	Lab	Honig and Pahlow 1993 Pahlow and Honig 1996 Staudacher et al. 1999 Honig and Thaysen 2002
Ireland	1994	No	No	Both	Fitzgerald et al. 1996
UK	1995	No	No	Both	Haigh et al. 1996 Weddell et al. 1996 Weddell et al 2002
Switzerland	1979	Yes	Yes	Lab	Wyss and Vogel 1997 Wyss 1997

## The EU authorisation of silage additives

- since 2004 all silage additives in the European Union (EU) require authorisation according to EC Regulation No. 1831/2003 (Article 10)
- EC Regulation distinguishes between '**technological additives**' (improved silage quality) and **zoo-technical additives** (improved animal performance)
- EU authorisation process focuses on **single, active components** of an additive re. safety (handling and intake) and efficacy (improved fermentation or aerobic stability)
- once an active component is authorised, it can be used by any additive company thereafter within the EU
- but most silage additives contain more than one active component → EU certification has only limited value for farmers
- main objective with the EU approval system is to make sure that only safe additives (re. health risks) are sold within the EU

## The German DLG additive approval scheme

- German approval system for silage additives was introduced in 1990 by DLG (German Agricultural Society in Frankfurt: [www.dlg.org/en/](http://www.dlg.org/en/) )
- DLG is a non-governmental agricultural organisation that has a long history in quality approval of agricultural commodities
- quality approved additives receive a 'DLG Quality Mark' ➔ 
- signals to the user that this product had passed through a series of tests and complies with the minimum quality criteria set up by DLG
- Sweden has joined the German approval scheme in 1993 and Switzerland uses DLG results for its own approval scheme
- all tests must be carried out at independent research institutes and in accordance to detailed **DLG guidelines** :

## The German DLG additive approval scheme

Action category 1 Field of application	Improved fermentation processes
<b>a</b>	Difficult to ensile forages Fermentability coefficient (FC) < 35 Roughage forages with an insufficient content of water-soluble carbohydrates and/or dry matter (DM)
<b>b</b>	Moderately difficult to easy to ensile forages in the lower DM range FC ≥ 35; DM < 35% e.g. grasses, forage legumes, silage maize, whole cereal plants, millet, Sudan grass
<b>c</b>	Moderately difficult to easy to ensile forages in the upper DM range FC ≥ 35; DM ≥ 35 to ≤ 50% e.g. grasses, forage legumes, silage maize, whole cereal plants, millet, Sudan grass Each with a sufficient content of water-soluble carbohydrates
<b>d</b>	Grain silage e.g. corn cob mix, earlage, moist cereal grains
<b>e</b>	Special types of forages Forages requiring ensiling agents to develop specific actions e.g. beets, pulps, pressed pulp, stillage, brewers grains or forages for which an ensiling agent is specifically designed

$$FC = DM + (8 \cdot WSC/BC)$$

DM in %FM  
WSC in %DM  
Buff.capacity: g lactate/100gDM

## Osmotolerance

All biological ensiling agents are additionally tested for osmotolerance during the annual quality test. Lactic acid bacteria with a low osmotolerance do not perform well in high DM silages such as in AC1c.

Where the detected osmotolerance levels in products certified for action category 1c are below 30% of the declared microbial counts over three consecutive years, the respective manufacturer is advised accordingly.

The osmotolerance-test or “Rostock Fermentation Test” (RFT) is an *in vitro* test using forage juice in test tubes.

## Comparison of the German DLG and the French INRA schemes

In 1994 and 1995 comparative ensiling trials with the same forage and the same wilting degree were carried out in Theix, France, for a direct comparison between the DLG and INRA schemes. In 1995, Switzerland joined in on the comparison.

## Testing silage additives in round bales – trial 2011

**The experiments indicated that silage additives can be tested in round bales when treated and untreated forages have the same DM content and when silage additives have been applied evenly and at the targeted dose. Furthermore, it is possible to expose round bales to an air stress treatment and thereby create more suitable conditions (i.e. aerobically instable controls) for the testing of silage additives**

## Conclusions

In the period between 1979 and 1995 several national silage additive approval schemes appeared in Europe. Today only two approval schemes are still in use, the EU authorization of additive components (compulsory) and the German DLG approval scheme of complete additives (voluntary).

The DLG approval scheme has a more consumer-oriented approach and can test complete additives under a rather large variety of conditions.

Comparative trials between the German and the French approval schemes showed that the aim of the silage additive testing system was fulfilled with both methods.

Guidelines for the test of silage additives should not be static but should be updated regularly to meet new arising challenges. The DLG Commission for Silage Additives investigates currently the possibility to introduce new test protocols for: a) silage additives, which show a positive response after a shorter storage time (AC2), b) silage additives that reduce the extent of protein degradation during ensilage or c) TMR additives, which extend the aerobic stability of total mixed rations (TMR)
